

Features

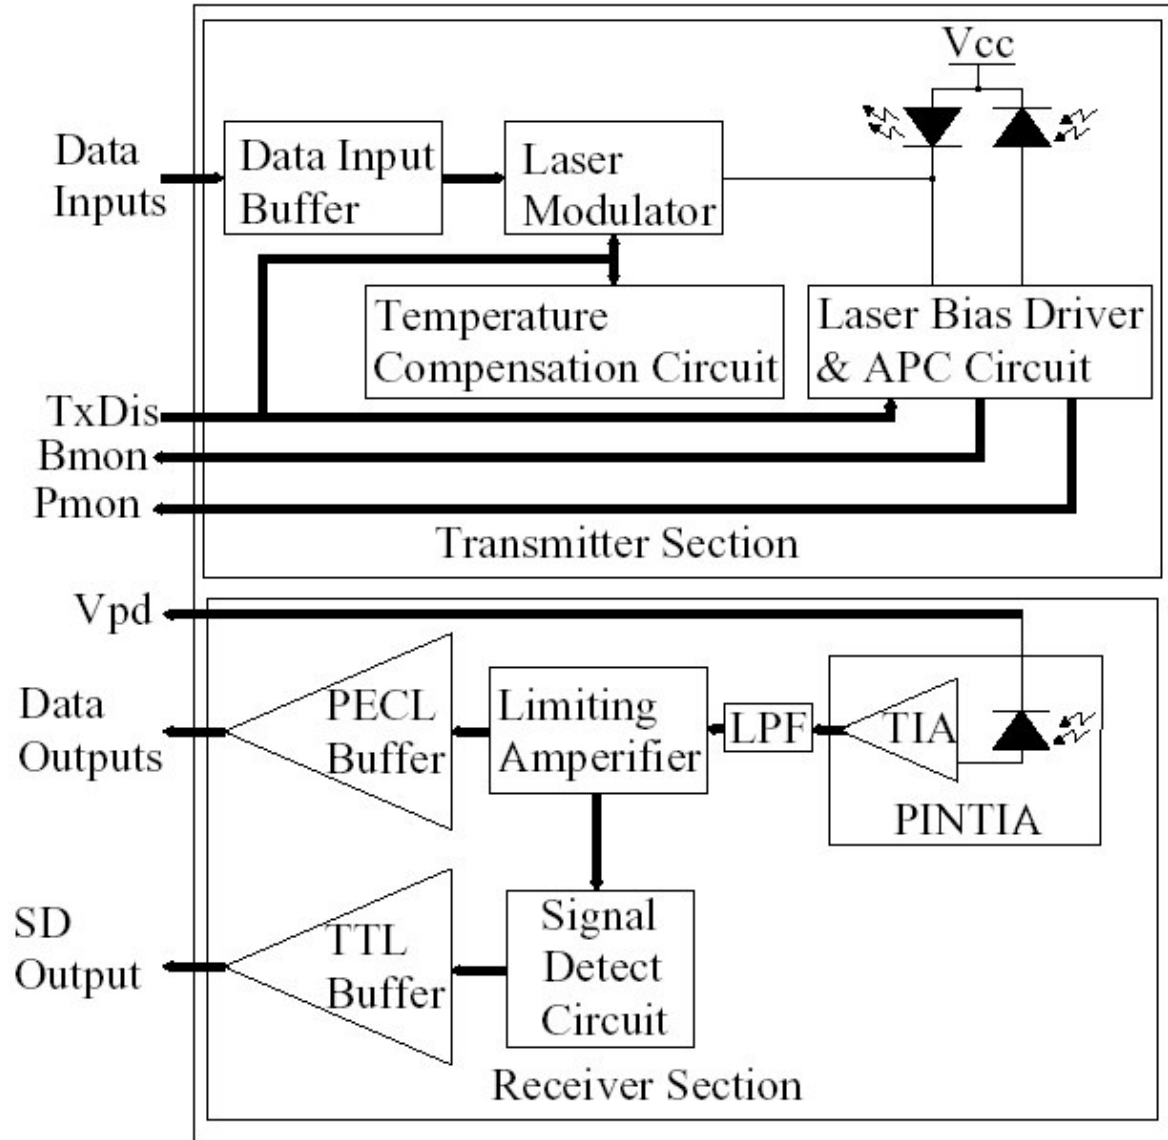

- Transceiver unit with independent
 - 1550nm DFB Laser diode transmitter
 - InGaAs PIN photodiode receiver
- Meet SFF MSA with duplex LC receptacle
- Metal enclosure for lower EMI
- +3.3V Single power supply
- Qualified to meet the intent of Bellcore reliability practices
- LVPECL logic interface simplifiers interface to external circuitry
- Links of 80km with 9/125 μm signal mode fiber (SMF)

Application

- SONET/SDH
- Ethernet
- ATM
- Switches
- Routers
- Hubs

General

The optical transceiver is a high performance, cost effective module for serial optical data communication application.

Transmitter Section

Figure 3 Power Monitor Circuit

Transmitter is designed for single mode fiber and operates at a nominal wavelength of 1550nm. The

transmitter module uses a DFB laser diode and full IEC 825 and CDRH class 1 eye safety. The output optical power can be disabled via the single TxDis pin. Logic LVTTTL HIGH level disables the transmitter. It contains APC function, temperature compensation circuit, PECL data TxDis input interface, LD bias current monitor circuit, power monitor circuit.

Note:

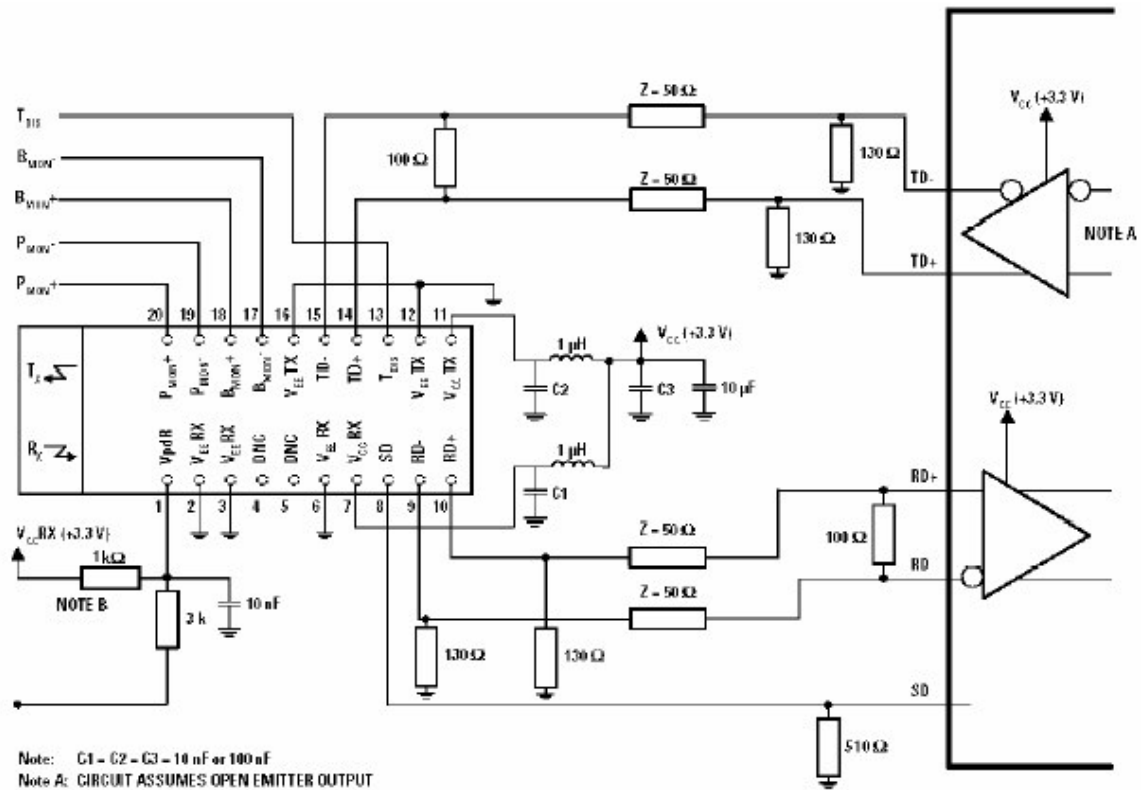

- The two mounting studs did not be connected to the interior of ground. They are provided for transceiver mechanical attachment to the circuit board. It is recommended that the holes in the circuit board be connected to chassis ground.**
- Those tabs did not be connected to the interior of ground. Connect four package grounding tabs to receiver signal ground.**
- This pin enables monitoring of photo detector bias current. The pin should either be connected directly to VCCR_X, or to VCCR_X through a resistor for monitoring photo detector bias current.**
- Directly connect these pins to the receiver ground plane.**
- Provide +3.3V DC via the recommend receiver power supply filter circuit. Locate the power supply filter circuit as close as possible to the VCCR_X pin.**
- Normal optical input levels to the receiver result in logic "1" output. Low optical input levels to the receiver result in a logic "0" output.**
- Provide +3.3V DC via the recommended transmitter power supply filter circuit. Locate the power supply filter circuit as close as possible to the VCCR TX pin.**
- Directly connect these pins to the transmitter signal ground plane.**

- 9. LVTTTL logic lever, to enable module connect to TTL logic low "0".
- 10. The laser diode bias current is accessible by measuring the voltage developed across pins 17 and 18.
- 11. The rear facet monitor is accessible by measuring the voltage developed across pins 19 and 20.
