SPUN-T Fiber Description and Polarization State Evolution

The controllably-spun birefringent-fiber or all fiber polarization transformer consists essentially of a long spun high-birefringence fiber, fabricated by slowly varying the spin rate of a birefringent fiber preform from very slow to very fast then back to very slow while the fiber is being drawn. The evolution of the eigenstate from a linear polarization state to an elliptical polarization state, then to a linear polarization state again, induced by slow variation of the intrinsic structure from linear anisotropy at the unspun of both end to elliptical anisotropy at the fast-spun of the middle, enables power coupling between local eigenstates, and relative power in these local eigenstates as a function of distance along the length of the fiber, the extinction ratio of the output state of polarization (SOP) as a function of distance and the normalized spin rate.

Features

- Low Insertion Loss
- Temperature Insensitive
- Precise Spinning Pitch
- High Current Sensitivity
- No Requirement for Quarter Wave Plate

Applications

- Current Sensors
- Lightning Sensor
- Polarization Controller
- Polarization transformers

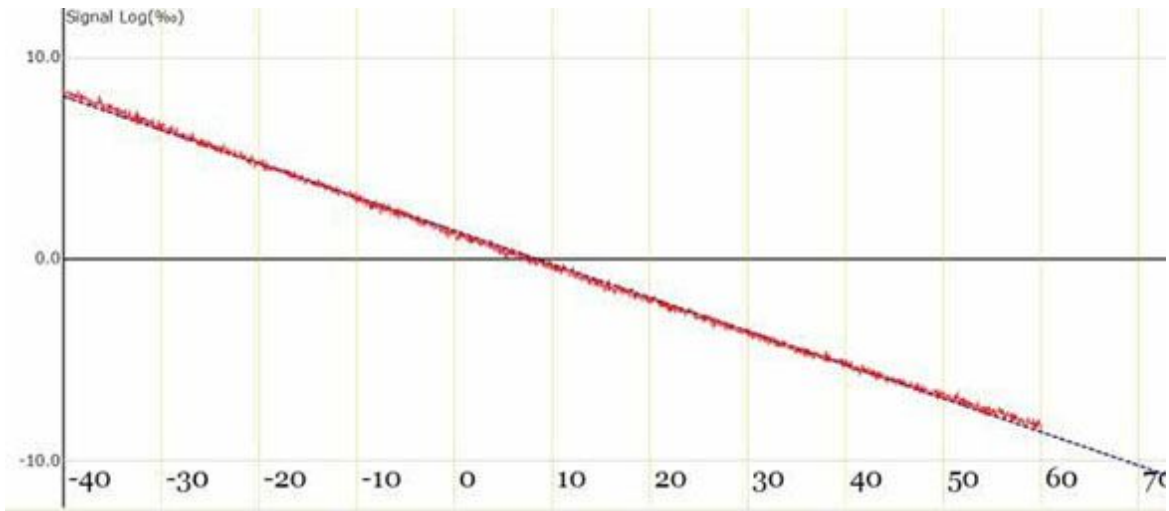

Specifications

Parameters		Unit	Performance
Operating Wavelength		nm	1310, 1480, 1550
Bandwidth		nm	±30
Pitch Length at Un-Spun End		mm	∞
Pitch Length at Fast Spun End		mm	3.2
Insertion Loss	Max	dB/m	0.1
Insertion Loss	Typ	dB/m	0.06
Modal Field Diameter	Typ	μm	9.0±0.5
Bending Radii	Min	mm	75
Operating Temperature		°C	-40 to +85

Temperature Characteristics (E-core Fiber)

Temperature Characteristics (PANDA Fiber)
